OFINE: A new way to find quickly what you need and exchange more quickly. Perfect for finding a new apartment or someone to help you doing the homework!!

A new way to exchange the carried goods and other stuff

Phone OFINE makes the exchange easier. Find a place to live, sell your car, find someone to study with...

Nowadays we don't have a lot of time. We want much more technology that makes our life easy and simple. Sometimes we know that something will be useful, but the time that we will spend on learning how to use it will be very long, so we never start using it.

Phone OFINE is an application that helps you to make the life much easier. Imagining to use a phone application that can help you to make an announcement of something that you want to sell. Imagining a phone application that may help you to find a perfect roommate or to know if the bike

that you see everyday and that you like is on sell.

Phone OFINE do all these things for you. What you only need to do is sending a message describing what you need or you offer. Categorize it by selecting tags from a list and that's all. The system will search someone that matches what you are looking for.

Phone OFINE is the first system that does something like this for phone devices. There are some other applications that may do something similar, but not in the same way. Nokia has an application named Sensor that tries to find people next to you and put in touch. There are a lot of other applications and internet forums that help you to announce things, but they are not the same because they are not automatic and it's really slow to exchange because normally there is a problem of distance.

Phone OFINE doesn't use much resources of your phone. What you only need is a SymbianOS phone with Bluetooth.

When to use

- Searching a roommate
- Selling your bike or other carried goods
- Find someone to study with
- Find someone to make a tandem

How to use the application

Using the application is really simple. Download the installation files from <http://persint.svn.sourceforge.net/viewvc/persint/projects/phoneofine/> and install on your phone. Start adding some needs and offers. It's simple: only do as sending a sms but change the type of the message to OFINE message. After this you can run the sharing application. There are 3 modes: sending offers, receiving offers, switching off. You can get more information from the readme if you are interested in developing the application.
